Notice of Liability

Every effort has been made to ensure that this manual contains accurate and current information. However, Yankee Bush Software LLC and the author shall not be held liable for any loss or damage suffered by readers as a result of any information contained herein. This manual is for educational use only and not for commercial use.

Trademarks & Copyrights

All trademarks and copyrights are acknowledged as belonging to their respective owners.

Licensing Information

Source code and object code can be freely distributed to students by accredited colleges and universities without requiring a license as long as there is no commercial application involved. In other words, no license is required if you use this manual for educational use only. You must obtain an Object Code Distribution license to embed code into a commercial product. This is a license to put code into a product that is sold with the intent to make a profit. There will be a license free for such situations. You must obtain a Source Code Distribution License to distribute source code. Again there is a fee for such a license. You can download shareware versions but you must obtain commercial licenses from the manufacturers to use full versions of their software and/or hardware.

s(n)

Problem Description

Take a block of length $L = 1000$ from the sequence,

$$s(n) = 0.4^n [\cos(\pi n/4) + \sin(3\pi n/4)]u(n)$$

Configure the following system to pass a select band of frequencies from the sequence $s(n)$. Here, $u(n)$ is the unit step sequence and $d(n)$ is a sequence drawn from uniform random noise lying between $[-1,1]$.

Design the filters to achieve the following:

1. Pass frequencies in the range from $[0, \frac{\pi}{3}]$ using the lowpass filter
2. Pass frequencies in the range from $[\frac{\pi}{2}, \pi]$ using the highpass filter

Plot the following sequences.

1. $s(n), d(n), y_1(n), y_2(n)$: length of each sequence = 1000
2. $S(k), D(k), Y_1(k), Y_2(k)$: 1024-point DFT of each sequence (magnitude, phase)
